For every Banach space X , the space $B(X)$ of bounded linear operators on X , with the composition of maps as product, is a Banach algebra. A C^* -algebra is a complex Banach algebra A with an antilinear involution $a \mapsto a^*$ such that $\|a^* a\| = \|a\|^2$. The space $B(H)$ of bounded linear operators on a Hilbert space H is a fundamental example of C^* -algebra. Banach space - Wikipedia The four-part treatment begins with an overview of the basic properties of holomorphic mappings and holomorphic domains in Banach spaces. The second section explores differentiable mappings, differentiable forms, and polynomially convex compact sets, in which the results are applied to the study of Banach and Fréchet algebras. Complex Analysis in Banach Spaces (Dover Books on ... Most theorems under real Banach space settings have their twin brothers for complex ones, say, the Hahn-Banach theorem. However, some theorems are not valid in complex Banach spaces, and vice versa. Harmonic Analysis, Partial Differential Equations, Complex ... the field of all real numbers and all complex numbers, respectively. The letters E and F always denote complex Banach spaces, not reduced to $\{0\}$. B_E denotes the closed unit ball of E , whereas S_E denotes the unit sphere of E . $L(E;F)$ denotes the Banach space of all continuous linear mappings from E into F , with the usual norm, that is $\|A\| = \sup\{\|Ax\| : \|x\| \leq 1\}$. Holomorphic functions on Banach spaces case $F = \mathbb{C}$. If $F = \mathbb{R}$ then X is called real vector space or simply vector space. If $F = \mathbb{C}$ then X is called complex vector space. In what follows, if we do not refer to a specific field then we always assume that $F = \mathbb{R}$. On the other hand, if $F = \mathbb{C}$ then we always explicitly mention this. Exercise 1.3.
